PREFACE.

When issuing the last edition of the "Universal Electrical Directory," we referred to the excessive competition and the consequent undercutting of prices that then prevailed. In many departments of British electrical industry, we regret that this condition of things has not materially altered. From various directions we learn that during 1906 the actual business turnover was larger than in the preceding year, but the margin of profit was cut very fine indeed. This fact, together with the continuous advance that has been taking place in the prices of practically all raw materials, has made safe estimating extremely difficult. Happily, there are not wanting signs that 1907 will bring a general improvement in profit obtainable.

The development of electricity supply from the commercial point of view is being pushed with greater zeal and enterprise. The claims of electricity as a lighting, heating and power agent are now being put before the public in a more educative and attractive manner, and with commendable persistency, in many parts of the kingdom. It is a movement which should, and we believe will, spread, until it touches every electricity supply undertaking, and will produce good results for electricity sellers, thus creating an increasing demand for electrical manufactures required in installation work.

The London power controversy is not settled, though it may be said to have advanced a stage. The present uncertainty undoubtedly hinders full progress—the possible consumer waits, and the supply authorities are inclined to hesitate to carry out big plant extensions.

In the provinces, where companies are developing the supply of power for mining and other industrial purposes, there has not, in all cases, been that degree of success that had been anticipated. As a result of more energetic action—and in one area of general reorganization—we may hope for matters to take a more promising turn shortly, causing a greater demand for certain classes of electrical manufactures.

In regard to electric tramway work, the bulk of it during the past year has been in connection with the L.C.C. conduit lines and the L.U.T. trolley system extensions. Some movement has been made in the direction of surface contact working in one or two places in the provinces.

Several events of importance have occurred in the electric railway department. Two further tube lines have been completed in London—the Baker Street and Waterloo and the Great Northern and Piccadilly—and when the Charing Cross and Euston line which is now constructing is finished, as it is expected to be in a few months, there will be no further work of this description in progress. The Hammersmith and City lines, and certain electrical sections of the G.W.R. in connection therewith, have also got to work. The Midland Railway has placed contracts in connection with the single-phase equipment of a short length of line, and the L.B. and S.C. single-phase sections are being proceeded with. The L. and N.W. has prepared a scheme for an electric line from Euston to Watford, which has yet to receive Parliamentary sanction. Everybody interested in the electrical industry eagerly awaits a bold step forward in railway electrification.

Electricity is becoming more and more in favour for train lighting, is making very satisfactory progress in mining work, and the electro-chemical departments command increasing attention. The continued progress in telephonic development is not likely to show any falling off as the years advance. In electro-mobiles a move forward is not only possible, but very probable in the near future. New and important discoveries in wireless telegraphy have been made.

One satisfactory result of the unattractive condition of home trade has been the increasing initiative and energy which many British firms have been displaying in foreign markets. It appears that there is greater scope there for doing profitable business than there is at home at present. We trust that 1907 may bring an improvement at home, through the revival of general trade—at last touching the electrical trade—as well as through this greater electrical activity abroad.

APPLIED MAGNETISM.

AN INTRODUCTION TO

THE DESIGN OF ELECTRO-MAGNETIC APPARATUS.

By J. A. KINGDON, B.A.,

Formerly Math. Schol., Pemb. Coll., Oxon.

OPINIONS OF THE PRESS.

"The elementary theory of the dynamo and motor is clearly set forth, and the chapter which gives the theory of non-sparking commutation appears to us a distinct advance on the ordinary text-book treatment. The short-circuited coil is not separated from the rest of the armature, and regarded by itself as possessing energy stored up in it by virtue of its self-induction. The armature and magnet are treated as a whole, and it is shown that the magnetic effect which would be due to the simple mechanical rotation must be balanced by the magnetic effect due to the changing current, so that the total flux remains constant if sparking is to be avoided. Appendices in which the units and formulæ employed are tabulated, and a good index, add not a little to the usefulness of the book, while a final word of praise should be given to it on the score of its clear arrangement of paragraphs, good type, and excellent printing."—*The Electrician.*

"This book, which is to serve as an introduction to the design of electro-magnetic apparatus, is one which can be highly recommended to all students, and to those who have only a practical knowledge of their profession. The matter is treated in a lucid and complete manner, and bears the stamp of original thought."—*Electrical Engineer.*

"In this book, however, we have the different aspects of applied magnetism, amongst which we may mention the alternator, dynamo motors, and transformer treated in accordance with our latest knowledge."—*Electricity.*

"The author's treatment of the electro-magnetic units, the magnetomotive force of a current, the magnetic traction and generation of E.M.F., is marked by thoroughness, perspicuity, and succinctness. Altogether we consider that Mr. Kingdon has written an admirable and workmanlike text-book, and its price should be an additional attraction to every student of the fascinating and useful science of electro-magnetism."—*Journal of Education.*

"The book is well printed and the diagrams are excellent. Beginning with the magnetic flux, and passing through electro-magnetic units, traction, the alternator, the dynamo, hysteresis, and heating of armatures, &c., it finishes with polyphase currents and rotary fields and magnetic measurements. The appendix, consisting of a list of units, symbols, and formulæ, is very handy. So is the index at the end. It is not much trouble to get an index, and it saves the student a vast amount of time."—*Literary World.*

"The theory of the 'flux' and the 'Faradaic idea' of the lines of magnetic force and retentiveness are all subjected to discussion and analysis. The generation of electromotive force, qualitative magnetism, hysteresis, and the heating of armatures, with polyphase currents and rotary fields, are dealt with theoretically and in detail with a conciseness and lucidity at which the most exacting student could hardly cavil. The chapters on units and the magnetomotive force of armature currents are especially so treated."—*Morning Post.*

"Mr. Kingdon has been fortunate in taking up the subject immediately after it had passed through the transition stage. He has judiciously avoided the use of the higher mathematics except in a very few instances where they could not be dispensed with. His opening chapters deal with the general principles of magnetism, explaining simply and concisely the law of the magnetic circuit. Numerical examples are here given and fully worked out, the practical units receive due attention, and a number of the most important problems in connection with the actions of currents on magnets are admirably discussed."—*Daily Chronicle.*
